Propagation Watch

As the graph below shows, solar activity has been very regular lately, rising slightly at the beginning of the month and dipping around the middle of the month. Combined with extremely low geomagnetic activity, this has given DXers good and predictable propagation. We look for both trends to continue over the next few weeks.

This means DXers can look for excellent openings on 20 meters, especially in the morning and again in the afternoon into the evening. With the geomagnetic field so quiet, the polar and high-latitude paths provide much exciting and rare DX, as these paths are usually weak and watery on the relatively few times they are open. Make the most of these openings.

The low bands continue to be hurt by high noise levels, but provide some good openings for those with good noise filtering (and good ears).

We expect the good conditions to continue until about Aug. 12, when a rise in geomagnetic activity and a drop in solar flux will diminish DX openings. Until then, good hunting!
